4
5 **Listing of Claims**

6
7 Claim 1 (Currently amended): A system comprising:
8 a network server, to provide media content on request through a wireline
9 network;
10 a wireless host, to request media content through a wireless network; and
11 a network gateway, coupled to each of the server and the wireless host, to
12 establish a communication channel from the server to the wireless host through
13 both the wireline network and the wireless network, wherein the communication
14 channel includes a transport layer protocol with control parameters for each of the
15 wireline network and the wireless network, wherein the protocol includes a fading
16 parameter which, when asserted, provides a receiving network element with an
17 indication that a communicatively coupled wireless host just emerged from a
18 fading condition.

19
20 Claim 2 (Original): A system according to claim 1, wherein the
21 transport layer protocol of the communication channel enables the network
22 gateway to distinguish transmission problems occurring within either network
23 component of the communication channel.

1 Claim 3 (Original): A system according to claim 1, wherein the
2 network server comprising:

3 a transmission rate controller to receive media content from an application
4 and control transmission over the wireline network; and

5 a congestion controller , to receive congestion control indications from the
6 network gateway in the transport protocol, estimate the available bandwidth over
7 the network, and to instruct the transmission rate controller to adjust the
8 transmission rate accordingly.

9
10 Claim 4 (Original): A system according to claim 1, the network server
11 further comprising:

12 an application error control interface, to receive a bit-error rate (BER)
13 control parameter from the network gateway via the transport protocol denoting
14 the bit-error rate (BER) experienced at the wireless host; and

15 a partial checksum generator, responsive to the application error control
16 interface, to generate checksum of a dynamically selected amount of the requested
17 content for inclusion in at least a subset of transmitted frames for error control
18 purposes based, at least in part, on the received BER control parameter.

19
20 Claim 5 (Original): A system according to claim 4, wherein the partial
21 checksum generator includes more data in the partial checksum when the BER
22 increases, less data when the BER decreases.

23
24 Claim 6 (Original): A system according to claim 1, the wireless host
25 comprising:

1 a fading timeout monitor, to identify degradation in transmission quality in
2 the wireless network component resulting from fading and/or multipath conditions,
3 and to issue a fading condition control parameter to the network gateway via the
4 transport layer protocol.

5

6 Claim 7 (Original): A system according to claim 6, wherein the fading
7 condition control parameter includes an indication to the network gateway of what
8 frame to commence retransmission of content lost due to fading and/or multipath.

9

10 Claim 8 (Original): A system according to claim 1, the wireless host
11 comprising:

12 a header analyzer, to analyze at least a partial checksum in a header of a
13 received frame of media content to determine whether an accurate frame was
14 received; and

15 a bit-error rate (BER) controller, coupled to the header analyzer, to generate
16 a BER control parameter for the network gateway via the transport layer protocol
17 denoting a running average of accurately received frames.

18

19 Claim 9 (Original): A system according to claim 1, the network
20 gateway comprising:

21 a congestion monitor, to monitor congestion of the communication channel,
22 and to issue a congestion control parameter to the network server via the transport
23 layer protocol.

1 Claim 10 (Original): A system according to claim 1, the network
2 gateway comprising:

3 a buffer, to receive frames of media content from the network server via the
4 wireline network component of the communication channel, and to selectively
5 provide frames of the received media content to the wireless host via the wireless
6 network component of the communication channel.

7
8 Claim 11 (Original): A system according to claim 10, the network
9 gateway further comprising:

10 a weighted scheduling module, coupled to the buffer, to schedule delivery
11 of media content from the buffer to the wireless host based on their priority.

12
13 Claim 12 (Original): A system according to claim 10, the network
14 gateway further comprising:

15 one or more retransmission modules, coupled to the buffer, to receive one
16 or more of a negative acknowledgment (NACK) control parameter and/or a fading
17 control parameter and determine whether the requested retransmission of one or
18 more frames can be accommodated.

19
20 Claim 13 (Original): A system according to claim 12, wherein the one or
21 more retransmission modules determine whether the requested retransmission may
22 occur by determining whether a start frame, identified within the received control
23 parameter, is available within the buffer.

1 Claim 14 (Original): A system according to claim 1, wherein the
2 transport layer protocol comprises:

3 a congestion control parameter, generated by the network gateway in
4 response to congestion detected along the communication channel.

5
6 Claim 15 (Original): A system according to claim 14, wherein the
7 congestion control parameter is sent to the server for purposes of throttling
8 transmission of the media content.

9
10 Claim 16 (Original): A system according to claim 1, wherein the
11 transport layer protocol comprises:

12 a fading control parameter, generated by a wireless host to provide an
13 indication to the network gateway that the wireless host has just concluded a
14 period of fading.

15
16 Claim 17 (Original): A system according to claim 16, wherein the
17 network gateway retransmits one or more frames of media content commencing at
18 a frame denoted by a received fading control parameter.

19
20 Claim 18 (Original): A system according to claim 1, wherein the
21 transport layer protocol comprises:

22 a negative acknowledgment (NACK) control parameter, generated by the
23 wireless host to denote one or more frames of media content received with an
24 unacceptably high bit-error rate (BER).

1 Claim 19 (Original): A method comprising:
2 receiving a request from a wireless host for content available from a
3 network server;
4 establishing a communication channel to service the request between the
5 wireless host and the network server over a wireless network and a wireline
6 network coupled to the server; and
7 adjusting transmission characteristics in one or more of the wireline
8 network and/or the wireless network to improve transmission quality based, at
9 least in part, on one or more control parameters of a transport layer protocol of the
10 communication channel which distinguish wireline transmission problems from
11 wireless transmission problems, wherein a parameter of the transport layer
12 protocol is a fading parameter..

13
14 Claim 20 (Original): A method according to claim 19, wherein the
15 transport layer protocol includes a control parameter to denote congestion in the
16 communication channel.

17
18 Claim 21 (Original): A method according to claim 20, further
19 comprising:

20 instructing a server of the requested content to reduce transmission rate to
21 alleviate congestion identified in the wired network component in response to
22 receiving a congestion control parameter.

1 Claim 22 (Original): A method according to claim 19, wherein the
2 transport layer protocol includes a control parameter to denote a fading condition
3 in a wireless network component of the communication channel.

4

5 Claim 23 (Original): A method according to claim 22, further
6 comprising:

7 calculating a delay measure when a fading condition control parameter is
8 received; and

9 retransmitting content from a buffer to the wireless host starting at a frame
10 denoted by the fading condition control parameter if the delay measure does not
11 exceed a threshold.

12

13 Claim 24 (Original): A method according to claim 23, wherein
14 calculating the delay measure comprises:

15 identifying the start time of the frame denoted in the fading condition
16 control parameter; and

17 subtracting the start time from the current project time to quantitatively
18 measure what kind of delay would be incurred by retransmitting frames lost during
19 the fading condition.

20

21 Claim 25 (Original): A method according to claim 19, wherein the
22 transport layer protocol includes a negative acknowledgment (NACK) control
23 parameter to denote that a frame was dropped due to a high bit-error rate (BER)
24 condition.

1 Claim 26 (Original): A method according to claim 25, further
2 comprising:

3 identifying whether the frame denoted in the NACK control parameter is
4 still available in a buffer of received media content;

5 calculating a delay measure when a NACK control parameter is received;
6 and

7 retransmitting the frame from the buffer to the wireless host if it is
8 identified within the buffer;

9 the delay measure not exceeding a threshold.

10
11 Claim 27 (Original): A method according to claim 25, wherein
12 calculating the delay measure comprises:

13 identifying the start time of the frame denoted in the NACK control
14 parameter; and

15 subtracting the start time from the current project time to quantitatively
16 measure what kind of delay would be incurred by retransmitting the lost frames.

17
18 Claim 28 (Canceled)

19
20 Claim 29 (Canceled)

21
22 Claim 30 (Currently amended): A transport layer protocol stored on
23 computer readable medium, to facilitate streaming of media content across
24 heterogeneous networks, the protocol comprising:

1 a congestion parameter, which provides a receiving network element with
2 an measure of congestion incurred in transmission within the network;

3 a fading parameter which, when asserted, provides a receiving network
4 element with an indication that a communicatively coupled wireless host just
5 emerged from a fading condition; and

6 a BER parameter, which provides a receiving network element with an
7 measure of bit error rate incurred in transmission within a wireless network.

8
9 Claim 31 (Original): A computer comprising a sender of the protocol as
10 recited in claim 30.

11
12 Claim 32 (Original): A computer comprising a receiver of the protocol
13 as recited in claim 30.

14
15 Claim 33 (Currently amended): A transport layer protocol stored on
16 computer readable medium, to facilitate streaming of media content across
17 heterogeneous networks, the protocol generated in accordance with the following
18 acts:

19 providing a server computer in a communications with a communications
20 network;

21 receiving data using the protocol by way of the communications network,
22 the protocol comprising:

23 a congestion parameter, which provides a receiving network element with
24 an measure of congestion incurred in transmission within the network;

1 a fading parameter which, when asserted, provides a receiving network
2 element with an indication that a communicatively coupled wireless host just
3 emerged from a fading condition; and

4 a BER parameter, which provides a receiving network element with an
5 measure of bit error rate incurred in transmission within a wireless network.
